Fiber Cement Siding?

[Join Our Mailing List](#)

RVM recently completed work at **Merrill Gardens in Huntington Beach**, a 3 story retirement community, installing fiber cement siding, one of the largest projects of its kind for Hardy Siding in Orange County. Even though this product has been around for 100 years, its green aspects, beauty, and durability has given it new attention.

Siding is not a typical project in California, but is a fantastic option for building owners that want to take advantage of a finish that can last 25 years. Fiber Cement siding outlast vinyl, wood, and stucco, often by decades, and resists many common building hazards including fire, wind, insects and rain, making it a great choice for commercial properties. Especially here in Southern California, where termites are common, and damage can cost owners tens of thousands of dollars. Also, it looks great and since it is made with cement, sand and recycled wood-fiber waste products it has that green advantage customers are looking for!
